# BEDIA

### The company

#### Measuring with system and passion

As a high performance and innovative company BEDIA developes, produces and distributes well thought out solutions for level and temperature monitoring.

We have been concentrating our skills in the domain of measuring filling levels and temperatures under extreme operating conditions. We are able to offer customized solutions to the specific requirements of our clients for small to large series. In doing so we are combining tried and tested technologies with innovative product ideas. Our expertise and flexibility are well demonstrated in the development of customer specific solutions.

One thing that all our products have in common is the nonexistence of moving or adjustable parts; our parts are not subject to mechanical interference and exhibit exceptional operational reliability. Since 1986 BEDIA Motorentechnik is a valued partner of numerous manufacturers of agricultural and construction machinery, compressors, engines, power train control systems and utility vehicles.

The high quality requirements of our world wide operating customers are our motivation for the constant improvement of our products and processes. The stable customer relationships of many years standing express the high quality of our products and the satisfaction of our customers.

We hope you will get a comprehensive overview of our products from this catalog. Please feel free to contact us, we will be happy to assist you with our advice and experience.

#### Our products at a glance

- capacitive level sensors for a versatile range of applications:
- CLS 20/25 for railway applications tested according to DIN EN 50155
- CLS 40/45 for off- and onroad applications with E1-type approval of the KBA
- CLS 50/55 for maritime applications with approvals of the classification societies
- intelligent, analog tank sensors for fuels and oils
- intelligent, analog hot wire sensors for monitoring oil sump fill levels
- temperature sens<mark>ors</mark>
- mechanical temperature switches
- electronic temperature switches
- electronic temperature sensors
- DC/DC converters

#### We are certified in accordance with ISO 9001:2015 and ISO 14001:2015.

### **TOUGH AMBIENT CONDITIONS**

#### **Mechanics**

The tank sensor ITS 60/ITS 65 is characterized by a particularly stable, but light mechanical system specifically designed for "Heavy Duty Applications".

The mounting flange and measurement tube are constructed from die cast aluminium.

This design permits the insertion of tank sensors up to 1200 mm in length, without additional support on the tank floor.

The flange hole distribution is compatible with commercially used tank sensors. This means that this system can be used without expensive conversions.

The capacitive measurement principle permits measurement of levels without mechanical moving parts. This increases stability and operating safety considerably.

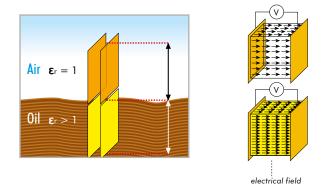

### **ALL HYDRAULIC AND ENGINE OILS ARE MEASURABLE**

#### Measurement principle

The ITS65 level measuring system is based on a capacitive measurement principle. A capacitor is formed by an electrically conducting plate and an aluminium tube. Depending on the level, the remaining air volume between the measurement electrodes varies. The resulting capacitive change is detected and processed by the microcontroller.

#### Additionally, the ITS65 offers measurement of the medium temperature through a sensor element positioned at the tip of the sensor.

#### Capacitance measurement

#### "Capacitive is not always capacitive!"

With capacitive level measurement, the variation in permittivity of different media is an important aspect. Conventional capacitive sensors can therefore measure only one particular medium type correctly. This can lead to a measurement inaccuracy of up to 50%, e.g. due to aging or change of the medium.

### Our sensor is equipped with a proprietary sensor structure. This permits automatic calibration of the medium, which is to be measured. This calibration occurs at levels as low as 50%.

The conductivity of the medium due to the existence of traces of water is compensated over a wide range by an integrated microprocessor by means of several plausibility checks.

### **FLEXIBILITY AND COMPATIBILITY**

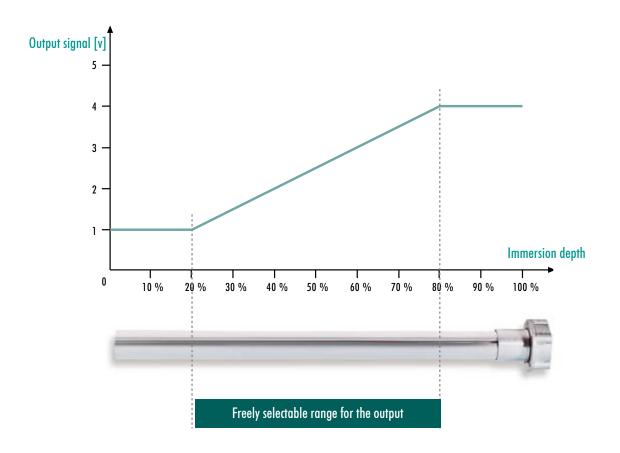

#### Evaluation and signal processing

The intelligent electronic integrated in the tank sensors offers a variety of processing and output options such as e.g.:

- PWM SIGNALS (DIGITAL OR RESISTANCE EMULATION FOR COMMERCIAL ANALOG MEASUREMENT INSTRUMENTS)
- VOLTAGE OUTPUT
- CURRENT LOOP
- CAN INTERFACE (ON REQUEST)

The measurement range, which can be programmed according to customer requirements, lies between 20 mm below the seal edge and 10 mm from the sensor end.

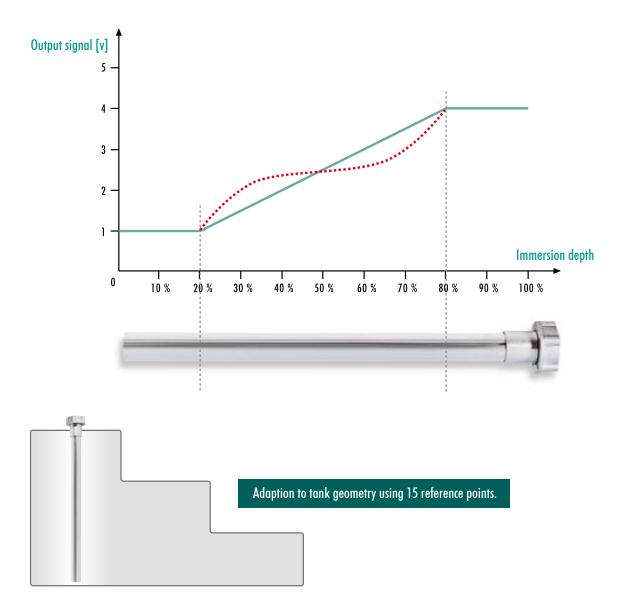

#### Example of use

### **TANK GEOMETRY ADAPTION**

Using a microcontroller not only permits linear tank geometries to be taken into account with the ITS 60 / ITS 65 tank sensor, but a variety of tank geometries to be correctly evaluated by programming up to 15 reference points.

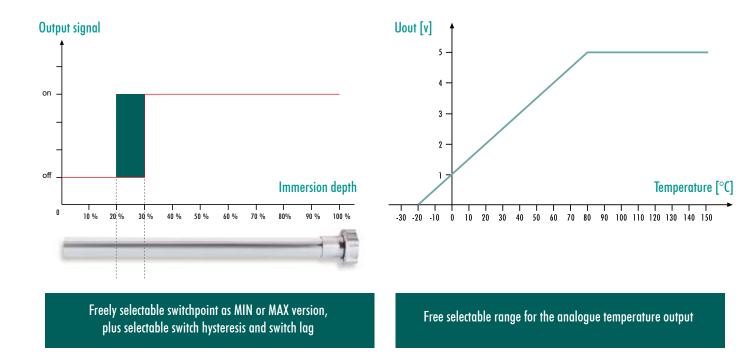

### **INTEGRATED SECOND OUTPUT**

An additional feature of the ITS is its freely configurable second output.

- 1. This output can be individually configured as either minimum or maximum switching point of the medium level. Furthermore, the switching point, the delay action and the switching hysteresis are programmable. A typical application of the switching point would be a refuelling facility with an automatic pump deactivation
- 2. On the ITS 65 the second output can alternatively be used as an analogue temperature output to determine the medium temperature within a range from -50 to +150 °C. The output type (analogue output voltage, current loop or PWM signal) in that case is of the same type as the level output

analogue temperature output

(ITS 65 only)

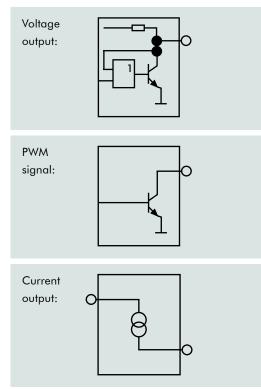

#### Level switch

### **OUTPUT**

#### Analogue outputs

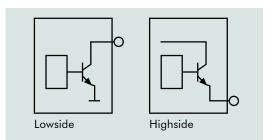

The analogue outputs are available as voltage output, as PWM output or as current loop.

### Output types

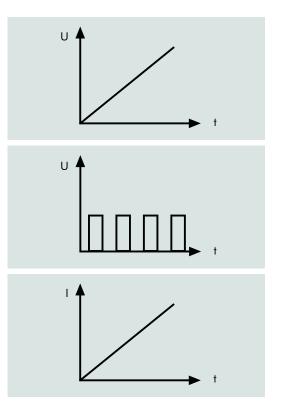

Other signal types available on request.

### Switching output

### Signal types

The switching output is available as a lowside switch or a highside switch.

### The switching output is short-circuit protected and suitable for 500 mA.

With inductive loads, a freewheeling diode must be connected in parallel to the load.

# **TECHNICAL DATA**

### Technical data

Measure principle:	<b>E</b> <sub>r</sub> – compensated level measurement		
	medium temperature measurement from –50 °C to 150 °C (ITS 65 only)		
Supply voltage:	12 V DC/24 V DC (-25%/+50%)		
Reverse connection protection:	Between supply voltage plus and minus		
Measurable mediums:	ITS 60: all diesel fuels		
	ITS 65: Oil mediums with an <b>E</b> , 1,8 6		
Sensor outputs:	Voltage output, PWM, Current loop, CAN		
	All outputs are short circuit protected		
Signal Characteristics::	Range as per customer requirements		
	Tank geometry: Linear or as per customer requirements		
Level switch- or Temperature output requirement:	Switching point as defined by the customer		
	(within the measuring range)		
	MIN or MAX function		
	Hysteresis as defined by the customer		
	Delay time as defined by the customer		
	Low side switching upto 500mA and short circuit proof		
	Temperature output (analogue) –50 °C to 150 °C		
Measurement deviation:	+/-3% referenced to the measurement range and value		
	Temperature: +/- 2 °C		
Installation position:	Vertical without support +/- 15° or ask for details		
Pressure resistance:	5 bar		
Environmental protection of flange:	IP 69K according to DIN 40050		
Environmental protection of connector:	Depending on version, up to IP69K according to DIN 40050		
Operating temperature:	ITS 60: –40 °C to 85 °C ITS 65: –40 °C to 125 °C		
Medium temperature:	ITS 60: –40 °C to 85 °C ITS 65: –50 °C to 150 °C		
Storage temperature:	ITS 60: –50 °C to 85 °C ITS 65: –50 °C to 125 °C		
El. connection:	3- or 4-wire cable; plug as per customer requirement		
	(standard: bayonet according to ISO 15170)		

# **TECHNICAL DATA**

Shock resistance*:	Shock test according to DIN IEC 68-2-6/ -27
Environmental test*:	Thermal shock test according to EN 60068-2
	Temperature cycling examination according to EN 60068-2
	Salt spray examination according to EN 60068-2
	Type of protection examination IP 67 and IP 69K according DIN 40050 part 9 $$
Flange material:	GD-AlSi10Mg (Nr. 239) DIN 1725
Profile material:	AlMgSi0, 5 F22 DIN 1725

\* These tests were performed according to the standards of construction machinery and commercial vehicle industry

A complete test report is available on request.

To be able to provide you with a quote or a finished sample, we will require various details from you. Because of the numerous options that our sensor can offer, we are particularly dependent on your co-operation.

The following table provides definitions for the terms used, together with an example for the parameterisation of a sensor. A dimensioned drawing is attached with all parameters listed.

All measurements are given in [mm] from the seal edge.

Please enter your data on page 35, and complete the entry with your personal information and the required number of pieces per year. To receive a quote or request a sample, please fax this page to the fax number provided.

If you require any assistance with the completion of this form, please get in touch with us.

#### Structure of the parameter sheet

Section	Parameter designation	Possible values	Note
This number can be found in the data sheet.	Designation of the parameter.	Describes the values or value ranges available for this parameter.	Important notes and additional informa- tion for this parameter.

Example for the parameterisation of a sensor for the tank and description depicted on page 9.

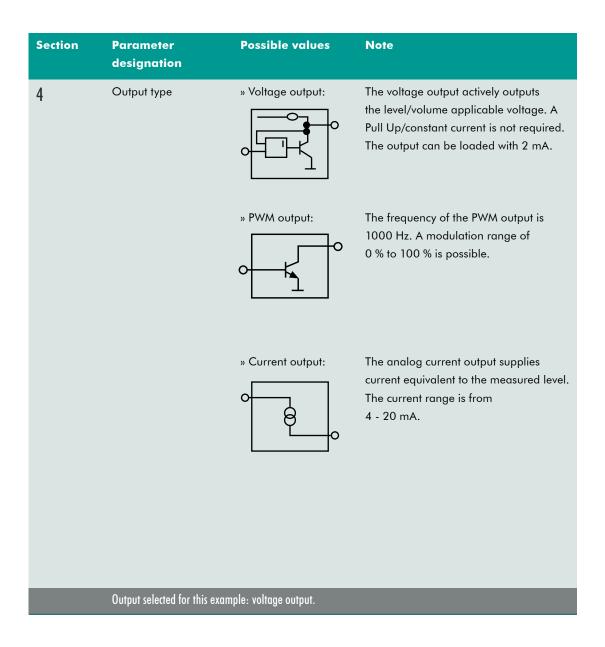

#### Mechanic

Section	Parameter designation	Possible values	Note
1	Mounting flange	<ul> <li>» 5-hole flange (standard), diameter of pitch circle = 54 mm</li> <li>» 6-hole flange, diameter of pitch circle = 80 mm</li> <li>» G 2" screw-in flange</li> </ul>	The screw-in flange consists of a sensor with a 5-hole flange and an adapter. The sensor and adapter are supplied pre-mounted (see drawing).
	A 5-hole flange was selec	ted for the example tank.	
2	Standard sensor pipe length	» Minimum length : 200 mm	The sensor pipe, which is open to the bottom needs no guidance and must not rest on the base of the tank so that the
		» Maximum length :	medium to be measured can circulate

Section	Parameter designation	Possible values	Note
3	Electrical connection	<ul> <li>» Bayonet cap</li> <li>ISO 15170</li> <li>(standard)</li> <li>» Cable with open end</li> <li>» Customer specified</li> <li>connector</li> </ul>	The electrical connection of the sensor is preferably implemented via a 4-wire cable with a bayonet connector ISO 15170 of protection class IP 69K. Other connectors can be installed on request.
	A bayonet cap ISO 15170 wc	is selected for the example sens	sor.
	Cable length	<ul> <li>» Minimum length : 100 mm</li> <li>» Standard length 800 mm</li> <li>» Other lengths on request.</li> </ul>	
	A length of 800 mm was sele	ected for the example sensor.	

### Level output

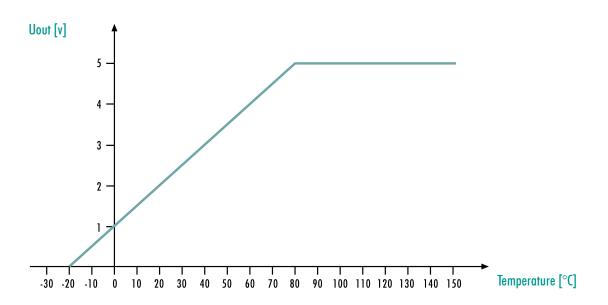

Section	Parameter designation	Possible values	Note
4	Analogue output signal	Sensor not immersed/ measurement start * Voltage 0 - 5 V * Voltage 0 - 10 V (only with 24 V supply) * Current 4 - 20 mA * PWM 0 - 100% Sensor immersed / measurement end * Voltage 0 - 5 V * Voltage 0 - 5 V * Voltage 0 - 10 V (only with 24 V supply) * Current 4 - 20 mA * PWM 0 - 100%	The output signal consists of an ana- logue start and analogue end. If the given start value is smaller than the end value, the sensor is programmed nor- mally. If the start value is large than the end value, then the signal is automati- cally inverted. If an analogue instrument is used, the output values can be given in % of the desired display value on the scale. In this case, a suitable display in- strument must be provided as a sample.
	The following output signal Analogue start: 0.5 V This signal is not inverted.	was selected for the example s Analogue end: 4.	

### Analogue temperature output (ITS 65 only)

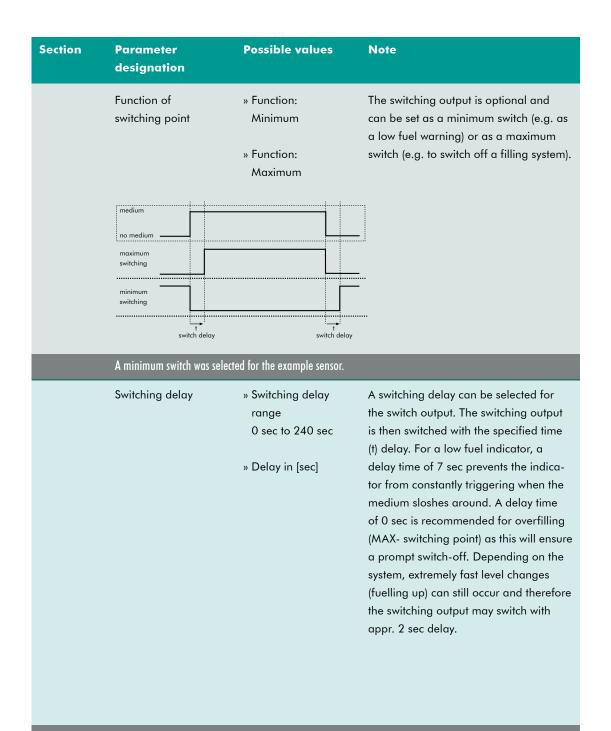

Section	Parameter designation	Possible values	Note
5	Analogue temperature output	Analogue tempera- ture output * Voltage 0 - 5 V * Voltage 0 - 10 V (only with 24 V supply) * Current 4 - 20 mA * PWM 0 - 100% Temperature measur- ing range -50 °C 150 °C	For measuring the medium's tempera- ture, a range within the threshold values can be freely selected. An analogue output voltage can be generated for this temperature range. The type of output (analogue voltage, current loop or PWM) is then always the same as for the level output.

### Analogue temperature output

### Level switch output

Section	Parameter designation	Possible values	Note
6	Switching point	<ul> <li>» Switching point range</li> <li>» See dimensioned drawing</li> <li>» Switching point in [mm]</li> </ul>	The sensor is equipped with one <b>switch-</b> <b>ing output.</b> When actuated, a minus potential is switched through the output. The distance of the switching point is measured from the seal edge and is freely selectable within the switching point range (see drawing).
	A switching point of 400	mm was selected for the example s	ensor

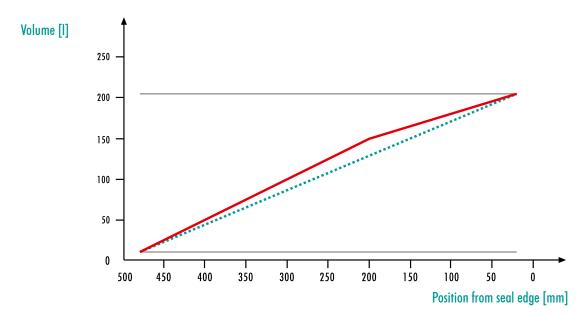

A switching delay of 7 sec was selected for the example sensor (typical MIN).

Section	Parameter designation	Possible values	Note
	Reset hysteresis	<ul> <li>» The switch-off</li> <li>point must lie</li> <li>within the swit-</li> <li>ching point range.</li> <li>» Switch-off point in</li> <li>[mm]</li> </ul>	The medium must under/overshoot a specific switch-off point before the switching output is reseted to its output condition. The position of the switch-off point is given to the switching point.
A reset hysteresis of 0 mm was selected for the example sensor.			

### Geometry adaption

Section	Parameter designation	Possible values	Note
7	Measurement range/Geometry adaptation	» Position from seal edge Data in [mm]	This parameter is used to specify the positions of the <b>measurement range</b> <b>start and measurement range end</b> . Where necessary, several geometry points can also be specified (see exam- ple). In total, 15 connection points can be defined. At least two points must be defined to specify the measurement range. If the analogue output shall be proportional to the tank volume, the setting points can be given in [V], [mA] or in [% PWM].

### Diagram for the example tank

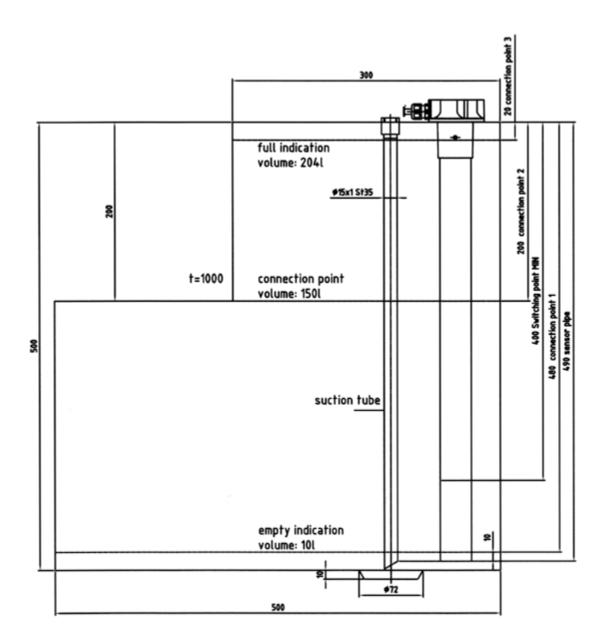

As the output signal of the example sensor is to be proportional to the contents of the tank the following connection points are defined:

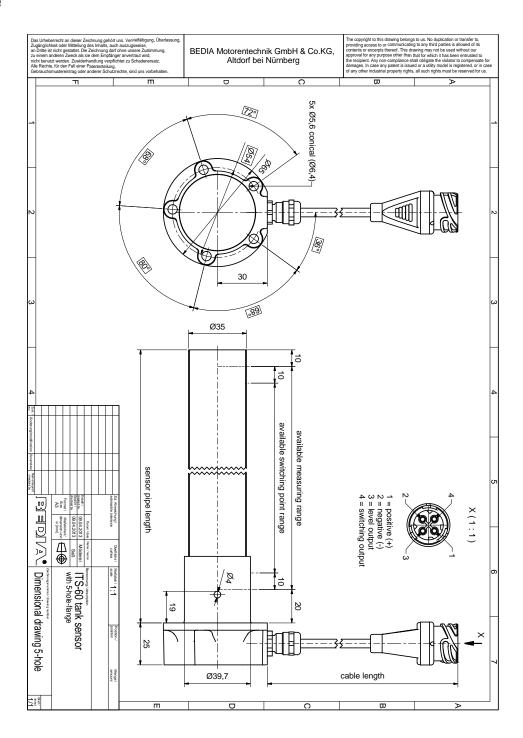

Connection point	Position from seal edge	Output value
1	480 mm	0,50 V
2	200 mm	3,59 V
3	20 mm	4,50 V

The output value "analogue start" is always given with the first setting point and the "analogue end" value is always given with the last setting point. If the signal is not to be given in proportion to the level but e.g. proportional to the actual content, additional setting points must be provided. Up to 15 setting points can be given.

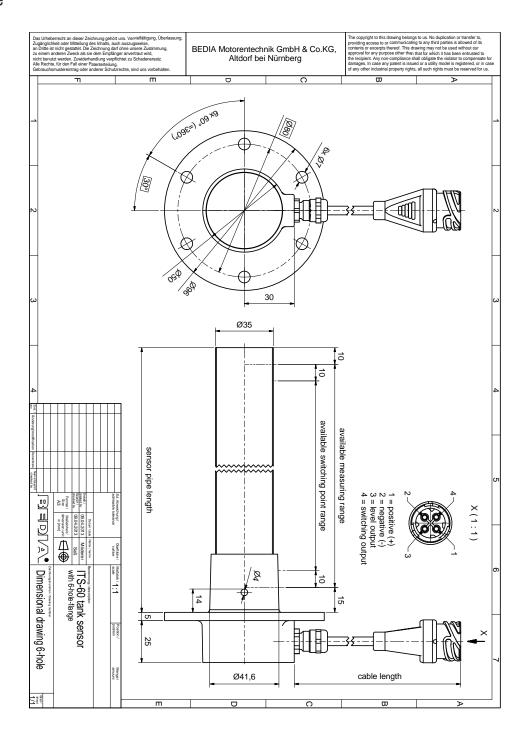

Example tank
